

1. [Thomas Problem 1.2.1] Write a code to approximately solve the boundary value problem

$$\begin{cases} v_t = \nu v_{xx}, & x \in (0, 1), \quad t > 0 \\ v(x, 0) = f(x), & x \in [0, 1] \\ v(0, t) = a(t), & t \geq 0 \\ v(1, t) = b(t), & t \geq 0 \end{cases}$$

Use $f(x) = \sin 2\pi x$, $a(t) = b(t) = 0$, $K = 10$ and $\nu = 1/6$. Find solutions at $t = 0.06$, $t = 0.1$, $t = 0.9$ and $t = 50.0$. For the first three values of t , use $\Delta t = 0.02$. To speed the solution of the last value of t , you might use a larger value for Δt . Determine how large you can choose Δt and still get results that might still be correct. Compare and contrast your solutions to the exact solutions.

We compute the exact solution using separation of variables. First look for eigenfunctions $X(x)$ of the operator $\partial^2/\partial x^2$ such that $X(0) = X(1) = 0$. Solving

$$X''(x) = \lambda X(x)$$

yields

$$X(x) = A \exp(\sqrt{\lambda}x) + B \exp(-\sqrt{\lambda}x).$$

Now $X(0) = 0$ implies $B = -A$ so that

$$X(t) = A \exp(\sqrt{\lambda}x) - A \exp(-\sqrt{\lambda}x),$$

and on the other hand $X(1) = 0$ implies $\exp(\sqrt{\lambda}) = \exp(-\sqrt{\lambda})$. Therefore $\exp(2\sqrt{\lambda}) = 1$ implies $2\sqrt{\lambda} = 2n\pi i$ and we obtain eigenfunctions $X_n(x)$ with eigenvalues λ_n given by

$$X_n(x) = \sin(n\pi x) \quad \text{and} \quad \lambda_n = -n^2\pi^2 \quad \text{for} \quad n \in \mathbf{N}.$$

Consider a solution of the form

$$v(x, t) = \sum_{n \in \mathbf{N}} T_n(t) X_n(x).$$

Plugging this into the differential equation obtains

$$\sum_{n \in \mathbf{N}} T'_n(t) X_n(x) = \sum_{n \in \mathbf{N}} \nu \lambda_n T_n(t) X_n(x)$$

and since the eigenfunctions $X_n(x)$ are linearly independent, it follows that

$$T'_n(t) = \nu \lambda_n T_n(t) \quad \text{for all} \quad n \in \mathbf{N}.$$

Solving this system yields that $T_n(t) = T_n(0) \exp(-\nu n^2 \pi^2 t)$ and consequently

$$v(x, t) = \sum_{n \in \mathbf{N}} T_n(0) \exp(-\nu n^2 \pi^2 t) \sin(n\pi x).$$

The initial condition

$$v(x, 0) = \sum_{n \in \mathbb{N}} T_n(0) \sin(n\pi x) = f(x) = \sin(2\pi x)$$

implies

$$T_n(0) = \begin{cases} 1 & \text{if } n = 2, \\ 0 & \text{otherwise.} \end{cases}$$

Therefore, the exact solution is

$$v(x, t) = \exp(-\nu 4\pi^2 t) \sin(2\pi x).$$

We use the finite difference scheme

$$\begin{cases} u_k^{n+1} = u_k^n + \rho \delta^2 u_k^n & \text{for } n = 0, \dots, N-1 \text{ and } k = 1, \dots, K-1 \\ u_k^0 = f(x_k) & \text{for } k = 0, \dots, K \\ u_0^n = a(t_n) & \text{for } n = 1, \dots, N \\ u_K^n = b(t_n) & \text{for } n = 1, \dots, N \end{cases}$$

where $x_k = k\Delta x$, $t_n = n\Delta t$, $\Delta x = 1/K$, $\Delta t = T/N$ and $\rho = \nu \Delta t / \Delta x^2$. We chose the values of K , N and T given in the table

K	N	T	Δx	Δt	ρ
10	3	0.06	0.1	0.02	0.333333
10	5	0.1	0.1	0.02	0.333333
10	45	0.9	0.1	0.02	0.333333
10	2000	50	0.1	0.025	0.416667
10	1750	50	0.1	0.0285714	0.47619
10	1500	50	0.1	0.0333333	0.555556

In the following program, and all other programs included in this homework assignment, the output will be displayed in four columns. This output describes the approximation obtained by the numerical scheme, the exact solution and the error between the approximation and the exact solution. Specifically we have

1. The column `xk` gives the value of x_k .
2. The column `uk` gives the approximation u_k^N for $v(x_k, T)$.
3. The column `vk` gives the exact value of $v(x_k, T)$.
4. The column `vk-uk` gives the error $u_k^N - v(x_k, T)$.

The program is

```

1 /* prog1.c -- Thomas Problem 1.2.1

```

Note that the last computation is clearly wrong because rather than decaying, the solution increases. In general, the scheme is unstable and therefore unreliable when $\rho > 1/2$.

2. [Thomas Problem 1.3.1] Solve Problem 1.2.1 using the leapfrog scheme

$$u_k^{n+1} = u_k^{n-1} + \frac{2\nu\Delta t}{\Delta x^2} (u_{k+1}^n - 2u_k^n + u_{k-1}^n)$$

with $\Delta t = 0.02$. For convenience, use values from the exact solution at Δt to get the leapfrog scheme started.

The program is

```

1 /* prog2.c -- Thomas Problem 1.3.1
2      Written May 2013 by Eric Olson */

0.8	inf	-1.26196892295452e-143	inf
0.9	-inf	-7.79939687131992e-144	-inf
1	0.000000000000000e+00	-3.24989132590493e-159	3.24989132590493e-159

Note that this method oscillates between $\pm\infty$ at $T = 50$ which is a noticeably poor result as the solution is supposed to converge to 0.

3. [Thomas Problem 1.3.2] Use $\Delta t = \Delta x^2/(6\nu)$ for the solution to Problem 1.2.1.

The program is

```
1 /*  prog3.c -- Thomas Problem 1.3.2
2      Written May 2013 by Eric Olson */
3
4 #include <stdio.h>
5 #include <math.h>

```

Note that this choice of Δt results in significantly more accurate solutions than the choices used in Problem 1.2.1.

4. [Thomas Problem 1.5.1] Solve the problem

$$\begin{cases} v_t + av_x = \nu v_{xx}, & x \in (0, 1), \quad t > 0 \\ v(x, 0) = f(x), & x \in [0, 1] \\ v(0, t) = v(1, t) = 0, & t \geq 0 \end{cases}$$

using the difference scheme

$$\begin{cases} u_k^{n+1} = u_k^n - R\delta_0 u_k^n + \rho\delta^2 u_k^n & \text{for } n = 0, \dots, N \text{ and } k = 1, \dots, K-1 \\ u_k^0 = f(x_k) & \text{for } k = 0, \dots, K \\ u_0^n = u_K^n = 0 & \text{for } n = 1, \dots, N \end{cases}$$

where $R = a\Delta t/(2\Delta x)$ and $\rho = \nu\Delta t/\Delta x^2$. Use $\nu = 1.0$, $a = 2$, $K = 20$ and $f(x) = \sin 4\pi x$. Find solutions at $t = 0.06$, $t = 0.1$, $t = 0.9$ using $\Delta t = 0.001$.

We first find the exact solution. We begin by finding eigenfunctions $X(x)$ so that

$$\nu X''(x) - aX'(x) = \lambda X(x) \quad \text{and} \quad X(0) = X(1) = 0.$$

The characteristic equation is

$$\nu r^2 - ar - \lambda = 0$$

from which we determine that

$$r_1 = \frac{a + \sqrt{a^2 + 4\nu\lambda}}{2\nu} \quad \text{and} \quad r_2 = \frac{a - \sqrt{a^2 + 4\nu\lambda}}{2\nu}.$$

It follows that

$$X(x) = A \exp(r_1 x) + B \exp(r_2 x).$$

Since $X(0) = 0$ we obtain $B = -A$. Consequently

$$X(x) = A \exp(r_1 x) - A \exp(r_2 x).$$

Now $X(1) = 0$ implies $\exp(r_1) = \exp(r_2)$ or that $\exp(r_1 - r_2) = 1$. It follows that

$$r_1 - r_2 = \frac{\sqrt{a^2 + 4\nu\lambda}}{\nu} = 2n\pi i$$

and so we obtain eigenfunction $X_n(x)$ with eigenvalues λ_n given by

$$X_n(x) = \exp(ax/2) \sin(n\pi x) \quad \text{and} \quad \lambda_n = -\nu n^2 \pi^2 - \frac{a^2}{4\nu} \quad \text{for } n \in \mathbf{N}.$$

Consider a solution of the form

$$v(x, t) = \sum_{n \in \mathbf{N}} T_n(t) X_n(x).$$

Plugging this into the differential equation obtains

$$\sum_{n \in \mathbf{N}} T'_n(t) X_n(x) = \sum_{n \in \mathbf{N}} \lambda_n T_n(t) X_n(x)$$

and since the eigenfunctions $X_n(x)$ are linearly independent, it follows that

$$T'_n(t) = \lambda_n T_n(t) \quad \text{for all } n \in \mathbf{N}.$$

Solving this system yields that

$$T_n(t) = T_n(0) \exp\left(-\nu n^2 \pi^2 t - \frac{a^2 t}{4\nu}\right)$$

and consequently

$$v(x, t) = \sum_{n \in \mathbf{N}} T_n(0) \exp\left(-\nu n^2 \pi^2 t - \frac{a^2 t}{4\nu}\right) \exp(ax/2) \sin(n\pi x).$$

The initial condition

$$v(x, 0) = \sum_{n \in \mathbf{N}} T_n(0) \exp(ax/2) \sin(n\pi x) = f(x) = \sin(4\pi x)$$

implies

$$\sum_{n \in \mathbf{N}} T_n(0) \sin(n\pi x) = \exp(-ax/2) \sin(4\pi x)$$

Multiplying by $\sin(m\pi x)$ and integrating yields that

$$\begin{aligned} T_m(0) &= 2 \int_0^1 \exp(-ax/2) \sin(4\pi x) \sin(m\pi x) dx \\ &= \frac{128am(-1 + (-1)^m \exp(-a/2))}{16m^4\pi^4 + (8a^2\pi^2 - 512\pi^4)m^2 + a^4 + 128a^2\pi^2 + 4096\pi^4}. \end{aligned}$$

Therefore, the exact solution is a complicated series. We turn to Maple to help with this series. The maple script

```

1 restart;
2 R1:=2*exp(-a*x/2)*sin(4*Pi*x)*sin(m*Pi*x);
3 a:=2;
4 R1;
5 R2:=int(R1,x=0..1) assuming m::integer;
6 R3:=collect(R2,m);
7 with(codegen):
8 Digits:=15;
9 R4:=[optimize([TM0=evalf(R3)])];

```

```
10 C(R4);
```

produces the output

```
a x
R1 := 2 exp(- ---) sin(4 Pi x) sin(m Pi x)
      2

a := 2

2 exp(-x) sin(4 Pi x) sin(m Pi x)

          2                         m
16 m Pi (-1 + exp(-1) (-1) )
R2 := - -----
          2           2           4           4           2           4   4
1 + 32 Pi + 2 m Pi + 256 Pi - 32 Pi m + m Pi

          2                         m
16 m Pi (-1 + exp(-1) (-1) )
R3 := - -----
          4           4           2           4           2           2           4
m Pi + (2 Pi - 32 Pi ) m + 1 + 32 Pi + 256 Pi

Warning, the protected name MathML has been redefined and unprotected
Digits := 15

m           2           2
R4 := [t1 = (-1.) , t5 = m , t6 = t5 ,
      157.913670417429 m (-1. + 0.367879441171442 t1)
TM0 = - -----
      97.4090910340020 t6 - 3097.35170428588 t5 + 25253.5546455394
      t1 = pow(-1.0,1.0*m);
      t5 = m*m;
      t6 = t5*t5;
      TM0 = -0.157913670417429E3*m*(-1.0+0.367879441171442*t1)/(
      0.97409091034002E2*t6-0.309735170428588E4*t5+0.252535546455394E5);
```

We replace `pow(-1.0,1.0*m)` with `(1-2*(m%2))` to obtain the exact solution which, for convenience, we keep in a separate file of utility programs

```

5. [Thomas Problem 1.5.2] Repeat Problem 1.5.1 with $\nu = 0.01$.

The program is

```

1 /*  prog5.c -- Thomas Problem 1.5.2
2      Written May 2013 by Eric Olson */
3
4 #include <stdio.h>
5 #include <math.h>
6 #include "util4.h"
7
8 main(){
9     printf("# prog5 -- Thomas Problem 1.5.2\n"
10        "# Written May 2013 by Eric Olson\n#\n");
11    nu=0.01;
12    int KK[]={20,20,20};
13    double TT[]={0.06,0.1,0.9};
14    int NN[]={60,100,900};
15    int J=sizeof(TT)/sizeof(double);
16    int j;
17    for(j=0;j<J;j++){
18        int K=KK[j],N=NN[j];
19        double T=TT[j],u[K+1];
20        dx=1.0/K; dt=T/N;
21        R=A*dt/(2*dx); rho=nu*dt/dx/dx;
22        printf("#\tK=%d N=%d T=%g A=%g nu=%g\n"
23               "#\tdx=%g dt=%g R=%g rho=%g\n",
24               K,N,T,A,nu,dx,dt,R,rho);
25        doinit(K,u);
26        dosolve(K,u,N,T);
27        doprint(K,u,T);
28        printf("\n\n");
29    }
30    return 0;
31 }
```

The output is

```

6. [Thomas Problem 1.5.3] Repeat Problem 1.5.1 and 1.5.2 with K=40.

The program is

```
1 /* prog6.c -- Thomas Problem 1.5.3
2      Written May 2013 by Eric Olson */
3
4 #include <stdio.h>
5 #include <math.h>
6 #include "util4.h"
7
8 main(){
9     printf("# prog6 -- Thomas Problem 1.5.3\n"
10        "# Written May 2013 by Eric Olson\n#\n");
11    int KK[]={40,40,40,40,40,40,40,40,40,40,40,40};
12    double TT[]={0.06,0.06,0.1,0.1,0.9,0.9,0.06,0.06,0.1,0.1,0.9,0.9};
13    int NN[]={60,600,100,1000,900,9000,60,600,100,1000,900,9000};
14    double NU[]={1,1,1,1,1,1,0.01,0.01,0.01,0.01,0.01,0.01};
15    int J=sizeof(TT)/sizeof(double);
16    int j;
17    for(j=0;j<J;j++){
18        nu=NU[j];
19        int K=KK[j],N=NN[j];
20        double T=TT[j],u[K+1];
21        dx=1.0/K; dt=T/N;
22        R=A*dt/(2*dx); rho=nu*dt/dx/dx;
23        printf("#\tK=%d N=%d T=%g A=%g nu=%g\n"
24               "#\tdx=%g dt=%g R=%g rho=%g\n",
25               K,N,T,A,nu,dx,dt,R,rho);
26        doinit(K,u);
27        dosolve(K,u,N,T);
28        doprint(K,u,T);
29        printf("\n\n");
30    }
31    return 0;
32 }
```

The output is

```

Note that in order to verify the answers with $K = 40$ one needs also to decrease the Δt time steps.

7. [Thomas Problem 1.5.7] Solve the following initial boundary value problem

$$\begin{cases} v_t = \nu v_{xx} + F(x, t), & \text{for } x \in (0, 1) \text{ and } t > 0 \\ v(x, 0) = f(x), & \text{for } x \in [0, 1] \\ v(0, t) = a(t), & \text{for } t \geq 0 \\ v(1, t) = b(t), & \text{for } t \geq 0 \end{cases}$$

where $\nu = 0.1$, $f(x) = 0$, $a(t) = b(t) = 0$ and $F(x, t) = \sin(2\pi x) \sin(4\pi t)$. Use $K = 10$ and $\Delta t = 0.05$ and find solutions at $t = 0.1$, $t = 0.9$ and $t = 2.0$. Resolve the problem in the above choice of parameters using $K = 20$ and $\Delta t = 0.01$.

First we derive the exact solution. Following the techniques used in Problem 1.2.1 let $X_n(x) = \sin(n\pi x)$ and $\lambda_n = -n^2\pi^2$ and write

$$v(x, t) = \sum_{n \in \mathbf{N}} T_n(t) X_n(x).$$

Plugging this into the differential equations yields

$$\sum_{n \in \mathbf{N}} T'_n(t) X_n(x) = \sum_{n \in \mathbf{N}} \nu \lambda_n T_n(t) X_n(x) + \sin(4\pi t) X_2(x).$$

Therefore

$$\begin{cases} T'_n(t) = \nu \lambda_n T_n(t) & \text{for } n \neq 2 \\ T'_2(t) = \nu \lambda_2 T_2(t) + \sin(4\pi t) & \text{for } n = 2. \end{cases}$$

Solution for $T_n(t)$ when $n \neq 2$ is the same as in Problem 1.2.1. When $n = 2$ we proceed as follows:

$$\frac{d}{dt} (T_2(t) \exp(-\nu \lambda_2 t)) = \sin(4\pi t) \exp(-\nu \lambda_2 t).$$

Therefore

$$\begin{aligned} T_2(t) \exp(-\nu \lambda_2 t) - T_2(0) &= \int_0^t \sin(4\pi s) \exp(-\nu \lambda_2 s) ds \\ &= \frac{1 - (\cos(4\pi t) - \nu \pi \sin(4\pi t)) \exp(\nu 4\pi^2 t)}{4\pi(\nu^2 \pi^2 + 1)}. \end{aligned}$$

It follows that

$$\begin{cases} T_n(t) = T_n(0) \exp(-\nu n^2 \pi^2 t) & \text{for } n \neq 2 \\ T_2(t) = T_2(0) \exp(-\nu 4\pi^2 t) + \frac{\exp(-\nu 4\pi^2 t) - \cos(4\pi t) + \nu \pi \sin(4\pi t)}{4\pi(\nu^2 \pi^2 + 1)} & \text{for } n = 2. \end{cases}$$

Solving for the initial condition

$$\sum_{n \in \mathbf{N}} T_n(0) \sin(n\pi x) = 0.$$

yields than $T_n(0) = 0$ for all n . Therefore the solution is

$$v(x, t) = \frac{\exp(-\nu 4\pi^2 t) - \cos(4\pi t) + \nu \pi \sin(4\pi t)}{4\pi(\nu^2 \pi^2 + 1)} \sin(2\pi x).$$

Integrating both sides of the equation from t_n to t_{n+1} yields

$$v(x, t_{n+1}) = v(x, t_n) + \int_{t_n}^{t_{n+1}} (\nu v_{xx}(x, s) + F(x, s)) ds$$

Approximating integral using the left endpoint yields

$$v(x, t_{n+1}) \approx v(x, t_n) + \Delta t (\nu v_{xx}(x, t_n) + F(x, t_n))$$

and the explicit method

$$u_k^{n+1} = u_k^n + R\delta^2 u_k^n + F(x_k, t_n).$$

Alternatively, for better accuracy, we can approximate the second term in the intergral using the midpoint method. This yields an explicit scheme of the form

$$u_k^{n+1} = u_k^n + R\delta^2 u_k^n + F(x_k, t_{n+1/2}).$$

The program is

```

Note that our numeric output verifies that the midpoint is generally more accurate than the left endpoint for approximating the contribution of the force $F(x, t)$.
